## Introduction

This report discusses hydrologic data relative to Los Angeles County for the period beginning October 1, 1998 and ending September 30, 1999. The Department has revised the format of this report to provide users with more useful data and a more efficient means of utilizing that data. The report consists of six sections.

### **PRECIPITATION**

Lists 273 active rainfall stations for which unpublished rainfall data are on file at the Department.

### **EVAPORATION**

Lists 13 evaporation station locations and data for this reporting period. Unpublished evaporation data from previous years are in file at the Department.

### **RUNOFF**

Lists 65 active streamflow stations. The mean of the daily flow rates during the reporting period, the reporting period's peak flowrate and historical peak flow rate for each of these stations are contained in this section. Unpublished stream flow data are on file at the Department.

### **RESERVOIRS**

Lists 15 dams and reservoirs for which inflow, outflow and storage data are on file at the Department.

### **EROSION CONTROL**

115 debris basins. Data on the debris production amounts for the reporting period are contained in this section. Unpublished debris production and inflow data are on file at the Department.

### **WATER CONSERVATION**

Lists 32 groundwater recharge locations. Data on the water conserved at various facilities and water injected at seawater barrier projects during the reporting period, and historical well level data for key wells are contained in this section. Unpublished water conservation data from previous years are on file at the Department.

## Los Angeles County

### **TOPOGRAPHY:**

The County of Los Angeles covers an area of 4,083 square miles and measures approximately 66 miles in the east - west and 73 miles in the north - south directions.

The terrain within the County can be classified in broad terms as being 25 percent mountainous; 14 percent coastal plain; and 61 percent hills, valleys, or deserts. Relief of the terrain ranges from sea level to a maximum elevation of 10,000 feet. The coastal plain is generally of mild slope and contains relatively few depressions or natural ponding areas. The slopes of main river systems crossing the coastal plain, such as the San Gabriel River, Los Angeles River, and Ballona Creek, range from 4 to 14 feet per mile.

Topography in the mountainous area is generally rugged with deep, V-shaped canyons separated by sharp dividing ridges. Steep walled canyons with side slopes of 70 percent or more are common. The gradient of principal canyons in the San Gabriel Mountains ranges from 150 to 850 feet per mile. Mountain ranges are aligned in a general east-west direction with the dominant range being the San Gabriel Mountains. The majority of mountain ridges lie below Elevation 5,000 feet. The total area above this level is approximately 210 square miles.

### **GEOLOGY - SOILS:**

Igneous, metamorphic, and sedimentary rock groups are all present within the County. The San Gabriel Mountains and Verdugo Hills are composed primarily of highly fractured igneous rock, with large areas of granitic rock formation being exposed. Faulting and deep weathering have produced porous zones in the rock formation; however, rock masses have produced a comparatively shallow soil mantle due to the steepness of slopes which accelerates erosion of the fine material.

Other mountains and hilly reaches are composed primarily of folded and faulted sedimentary rocks, including shale, sandstone, and conglomerate. Residual soils in these areas are shallow and generally less pervious than those of the San Gabriel Mountain range.

Valley and desert soils are alluvial and vary from coarse sand and gravel near canyon mouths to silty clay, clay and sand and gravel in lower valleys and the coastal plain. The alluvial fill has accumulated by repeated deposition of sediments to depths as great as several thousand feet. This fill is quite porous in areas of relatively low clay content. Geologic structures and irregularities in the underlying bedrock divide the alluvium into several groundwater basins. Valley soils are generally well drained but there are a few areas containing perched water.

### **LAND USE:**

The principal vegetative cover of upper mountain areas consists of various species of brush and shrubs known as chaparral. Most trees found on mountain slopes are oak, with alder, willow, and sycamore found along streambeds at lower elevations. Pine, cedar, and juniper are found in ravines at higher elevations and along high mountain summits. The chaparral is extremely flammable, and extensive burns of the mountain vegetation frequently occur during dry, low-humidity weather accompanied by high winds. Chaparral has the ability to sprout following fire and grows rapidly to re-establish the watershed cover within a period of 5 to 10 years.

Grasses are the principal natural vegetation on the hills. Much of the hill land and nearly all of the valley land in the densely populated portion of the County south of the San Gabriel Mountains has been converted to urban and suburban use. Development of the Santa Clarita Valley and desert areas to the north of the San Gabriel Mountains is sparse at present but is proceeding rapidly.

### **CLIMATE:**

The climate within the County varies between subtropical on the Pacific Ocean side of the San Gabriel Mountain range to arid in the Mojave Desert. Nearly all precipitation occurs during the months of December through March. Precipitation during summer months is infrequent, and rainless periods of several months are common. Snowfall at elevations above 5,000 feet is frequently experienced during the winter storms, but the snow melts rapidly except on higher peaks and the northern slopes. Snow is rarely experienced on the coastal plain.

January and July are the coldest and warmest months of the year, respectively. At the Los Angeles civic center, the 30-year average daily minimum temperature for January is 48 degrees (Fahrenheit) above zero. The average daily maximum temperature for July is 84 degrees. At Mount Wilson (Elevation 5,850 feet), the 30-year average daily minimum temperature for January is 35 degrees above zero and the average daily maximum temperature for July is 80 degrees.

**HYDROMETEOROLOGIC CHARACTERISTICS:****Coastal and Mountain Areas**

Precipitation (rainfall) in the Los Angeles area occurs primarily in the form of winter orographic rainfall associated with extra tropical cyclones of North Pacific origin. Major storms consist of one or more frontal systems and occasionally last four days or longer. Air masses and frontal systems associated with major storms commonly extend for 500 to 1,000 miles in length and produce rainfall simultaneously throughout the County. Major storms approach Southern California from the west or northwest with southerly winds which continue until frontal passage. The mountain ranges lie directly across the path of the inflow of warm, moist air, and orographic effects greatly intensify precipitation.

The seasonal normal rainfall in Los Angeles County ranges from 27.50 inches in the San Gabriel Mountains to 7.83 inches in the desert. The annual County average for the annual rainfall for Los Angeles County is 15.65 inches. The effects of snowmelt upon flood runoff is of significance in the few cases when warm spring rains from southerly storms fall on a snowpack. During major storms, temperatures throughout the County may remain above freezing. Average individual storm rainfall amounts and intensities conform to a fairly definite aerial pattern which reflects general effects of topographic differences.

**Desert Areas**

Summer convective rainfall is principally experienced in the upper San Gabriel Mountains and the Mojave Desert regions. In many desert areas, the most serious flooding occurs as a result of summer convective storms.

**RUNOFF CHARACTERISTICS:****Mountain Areas**

In mountain areas, the steep canyon slopes and channel gradients promote a rapid concentration of storm runoff. Depression storage and detention storage effects are minor in the rugged terrain. Soil moisture during a storm has a pronounced effect on runoff from the porous soils supporting a good growth of deep-rooted vegetation such as chaparral. Soil moisture deficiency is greatest at the beginning of a rainy season, having been depleted by the evapotranspiration process during the dry summer months. Precipitation during periods of soil moisture deficiency is nearly entirely absorbed by soils, and except for periods of extremely intense rainfall, significant runoff does not occur until soils are wetted to capacity. Due to high infiltration rates and porosity of mountain soils, runoff occurs primarily as subsurface flow or interflow in addition to direct runoff. Spring or base flow is essentially limited to portions of the San Gabriel Mountain range. Consequently, most streams in the County are intermittent. Runoff from a mountain watershed recently denuded by fire exceeds that for the unburned state due to greatly increased quantities of inorganic debris present in the flow and increased direct runoff resulting from lowered infiltration rates. Debris production from a major storm has amounted to as much as 223,000 cubic yards per square mile of watershed. Boulders up to eight feet in diameter have been deposited in valley areas a considerable distance from their source.

Debris quantities equal in volume to storm runoff, representing a 100 percent bulking of runoff from a major storm, have been recorded. Where debris-laden flow traverses an alluvial fill unconfined by flood control works, flood discharges follow an unpredictable path across the debris cone formed at the canyon mouth.

**Hill and Valley Areas**

In hill areas, runoff concentrates rapidly from the generally steep slopes; however, runoff rates from undeveloped hill areas are normally smaller than those from mountain areas of the same size. In those hill areas which have been developed for residential use, concentration times become considerably decreased due to drainage improvement, and runoff volumes and rates have increased due to increased imperviousness. On the other hand, erosion is controlled and debris is minimized from storm flows. Debris production rates from undeveloped hill areas are normally smaller than those from mountain areas of the same size.

In highly developed valley areas, local runoff volumes have increased as the soil surface has become covered by impervious materials. Peak runoff rates for valley areas have also increased due to elimination of natural ponding areas and improved hydraulic efficiency of water carriers such as streets and storm drain systems.

## Flood Control & Water Conservation

### **FLOODS . . . AN OLD STORY:**

Floods in Los Angeles County have been recorded as far back as the days of the Mission Padres. For centuries waters have swept out of the San Gabriel Mountains causing extensive property damage and taking a great toll of lives.

Such a flood occurred in 1914 causing over \$10 million in property damage and taking many lives. As a result, the State legislature in 1915 enacted the statute creating the Los Angeles County Flood Control District. The responsibilities and authority vested in the Flood Control District were, in 1985, transferred to and are now part of the Los Angeles County Department of Public Works.

The Department, under the Flood Control Act, has two tasks. . . control the floods and conserve the water.

### **CONTROLLING THE WATERS:**

Successful early bond issues financed construction of the 15 dams which the Department built in the San Gabriel Mountains and foothills to impound storm waters until they could be safely released. Debris basins were constructed to trap eroded materials which had caused terrible damage in the past. Flood channel improvements were undertaken to confine the waters and convey them safely through the urbanized areas to the ocean.

District engineers prepared a Comprehensive Plan in the early 1930's which would control flooding and save as much of the water as practicable when fully implemented.

Federal legislation in 1936 brought the United States Army Corps of Engineers into the local flood control picture. Since that time, the two agencies have been jointly pursuing implementation of the Comprehensive Plan. The Department also cooperates with the United States Natural Resources Conservation Service and Forest Service in erosion control.

### **CONSERVING THE WATERS:**

In addition to its flood control program, the Department has the equally important mission of conserving as much of the storm and other waste waters as practicable. The use of water conservation facilities in or adjacent to river channels and their tributaries permits water to be percolated into groundwater aquifers or basins for later pumping and supply to consumers. These water conservation facilities are located in areas where the underlying soils are composed of porous sands and gravel formations. Some are shallow and resemble rice paddies, while others are deep basins which were once gravel pits.

The importance of this activity is apparent when it is realized that about 30 to 40 percent of the water used in the County is pumped from groundwater supplies. The growth of the County, combined with periodic droughts, seriously depleted these supplies on numerous occasions throughout the history of the County.

Other major conservation efforts by the Department include combating the serious salt water intrusion into groundwater supplies inland from the Pacific Ocean and utilizing imported and reclaimed water to help replenish groundwater supplies.

### **ORGANIZED TO DO THE JOB:**

Day-to-day administration of Department affairs is vested in the Director of Public Works who is appointed by and responsible to the Los Angeles County Board of Supervisors. A part of the Department's activities involve the planning, design and construction of flood control and water conservation facilities, and the operation and maintenance of dams, debris basins, spreading grounds, channels, and storm drains.

## P R E C I P I T A T I O N

### PRECIPITATION

The Department operates and maintains a network of rain gage stations to collect rainfall (precipitation) data for the purposes of in-house engineering and design of flood control and water conservation facilities.

#### RAINFALL AMOUNTS:

Although the Department operates and maintains 273 raingage stations, including those which record amounts for durations ranging from 5 minutes to 24 hours, only [daily](#) and [annual](#) amounts for the report period are listed herein. Additional data (e.g., intensities) can be obtained by contacting the [custodian](#) of hydrologic records.

#### ALERT SYSTEM

##### *Automated Local Evaluation in Real Time*

The Department of Public Works operates and maintains a state-of-the-art ALERT computer system to monitor meteorological conditions in the County and Southern California in real time, i.e., as they occur. The system includes a network of field sensors that monitor and receive precipitation amounts including rainfall data from the Corps of Engineers' Los Angeles Telemetry System. During the 1996-97 Water Year the Department converted all of its automatic recording raingage stations from weighing bucket mechanisms to ALERT stations with tipping bucket mechanisms.

#### COOPERATION:

The cooperation of observers in furnishing rainfall data to the Department as a public service is appreciated. The effort of the many agencies and individuals who have so freely cooperated with us in the collection of this data have resulted in the large number of complete records for the period covered by this report.

Data from 22 stations of the Department's records are reported and published by the National Oceanic and Atmospheric Administration (NOAA).

Monthly and seasonal data for 13 active evaporation stations were reported to the Department during the reporting period. Daily records of active and inactive Department stations, as well as some stations of other agencies, are available in the Department's files. This data can be obtained by contacting the [custodian](#) of hydrologic records.

**COOPERATION:**

The Department receives evaporation data from The Metropolitan Water District, Palmdale Water District, California Department of Water Resources, and Descanso Gardens.

**LENGTH OF RECORD:**

The Los Angeles County Flood Control District (now administered by the Department) installed its first land pan in March 1929 at Santa Anita Dam. The Department has 30 evaporation stations which have records of 15 seasons or more in the Department's files.

The Department operates 65 streamflow measurement stations (62 water-stage recording stations and 3 witness gages). Daily mean flow data and maximum instantaneous flow for each station were collected for these [stations](#) during the reporting period. Additional data can be obtained by contacting the [custodian](#) of hydrologic records.

**ALERT SYSTEM:***Automated Local Evaluation in Real Time*

The Department operates and maintains the ALERT computer system to monitor meteorological conditions at 23 river stage locations in the County.

The Department's ALERT System also receives rainfall, streamflow, and reservoir data from the Corps of Engineers' Los Angeles Telemetry System.

**CUSTODIAN:**

**COOPERATION:**

The Department receives or has access to streamflow data from other agencies. Data from 5 of the Department's stations are published in the United States Geological Survey's annual water supply papers.

Agencies with which the Department exchanges data are:

- United States Geological Survey, Water Resource Division
- United States Army Corps of Engineers
- State Department of Water Resources
- The Metropolitan Water District of Southern California
- San Gabriel River Water Committee

**RESERVOIRS:** Following the damaging flood of 1914 and creation of the Los Angeles County Flood Control District in 1915, a program of flood control and water conservation was initiated by the District. Part of this program included the construction of 15 dams which were completed between 1920 and 1939. These dams continued to be operated and maintained by the Department to control flood waters during storm periods. The Department makes post storm releases, when feasible, in amounts that can be conserved in downstream spreading grounds and by channel percolation. In addition, five Corps of Engineers' dams, Lopez, Hansen, Santa Fe, Sepulveda, and Whittier Narrows Dams, are operated by the Corps in conjunction with the Department dams to achieve flood control and/or water conservation.

**RECORDS:**

The Department's 15 dams and reservoirs' locations are shown on the map. Data on the yearly reservoir operation summaries for each reservoir are provided by selecting from the index on the left. Data for these facilities can be obtained by contacting the custodian of hydrologic records.

### EROSION CONTROL

Each year eroded material in various forms (debris consisting of rock, sand, trees, etc.) flows out of the mountain watersheds of Los Angeles County. In an effort to control this potentially disruptive force, the Department maintains a series of debris basins in canyon mouths and upstream stabilization structures in selected watersheds.

#### DEBRIS BASINS:

The purpose of a debris basin is to entrap the sediment flows emanating from the canyon and let the relatively desilted water pass into the downstream flood control channels.

The Department maintained 115 debris basins during the reporting period. The combined total maximum capacity of the basins is approximately 7,780,900 cubic yards. [Design data](#) on these facilities are in a table and their locations are shown on [Location Map](#) (in Appendix F).

Data for sediment inflow at individual debris basins and Unpublished information may be obtained by contacting:

Los Angeles County Department of Public Works  
Water Resources Division  
P.O. Box 1460  
Alhambra, CA 91802-1460  
...or telephone: (626) 458-6120

#### STABILIZATION STRUCTURES:

The Department has constructed stabilization structures to control erosion in natural canyons. These structures serve to prevent down cutting by stabilizing alluvium deposits. In addition, they store debris generated by the watershed and serve to stabilize side banks, reducing side slope sloughing and bank erosion.

The Department maintained 217 stabilization structures in 47 major watersheds during the reporting period. The Department has not constructed any stabilization structures since the 1973-74 water year.

#### EMERGENCY STRUCTURES:

The Department has constructed emergency structures (rail and timber) to entrap the debris from burned watersheds. The structures serve to protect improvements (road, channel, residence, etc.) located downstream of the watersheds.

During the reporting period, 32 emergency structures existed with a total maximum capacity of 253,000 cubic yards. Maps of areas burned during the reporting period can be obtained by contacting the *custodian* of hydrologic records.

#### FOOTNOTES

- (1) Lowest clear water outlet, not spillway.
- (2) Elevation of spillway notch.
- (3) Flow line of sluiceway.
- (4) Elevation of spillway into outlet channel. Elevation of overflow spillway 1,036.9 feet.
- (5) One 30-inch reinforced concrete pipe.
- (6) Four 36-inch corrugated metal pipes.
- (7) One 36-inch reinforced concrete pipe. (Elevated inlet)
- (8) Debris capacity available within right of way limits.
- (9) Pit-type basin.
- (10) Information unavailable.
- (11) Special cleanout required due to limited storage.
- (12) Cleanout required when debris reaches or exceeds elevation 1128.9 feet against face of dam.
- (13) Values are combined with Cooks debris basin.
- (14) Spillway level storage capacity.
- (15) Data taken from design drawings.
- (16) 7 feet in diameter circular outlet type.
- (17) The maximum capacities have been rounded off with regard to appropriate precision consistent with the assumptions used in the development of Hydrology and Sedimentation Manual.
- (18) New maximum capacity based on "As-Built" topographic map number 78B-T56.

## WATER CONSERVATION

### WATER CONSERVATION

Information presented in this section includes amounts of local, imported, and reclaimed water conserved in spreading areas and information on the seawater barrier projects which prevent salt water intrusion into groundwater zones in the coastal areas. Pertinent data is presented regarding the locations and descriptions of the Department's water conservation facilities, as well as facilities owned by others. Additional data not presented in this report or its appendices can be obtained by contacting the [custodian](#) of hydrologic records.

### CONSERVING THE WATERS

In addition to the flood control program, the Department has the equally important mission of conserving as much of the storm and other waters as practicable. The use of water conservation facilities adjacent to river channels and in soft-bottom channels permits water to percolate into groundwater basins for later pumping. These water spreading facilities are located in areas where the underlying soils are composed of permeable formations and in hydraulic connection with the underlying aquifer.

The various types of water conserved, local, imported, and reclaimed are construed to have the following meanings in this section: Local water is primarily runoff due to rainfall on the mountain and valley watersheds, dam releases, and rising water within the County. Imported water is water originating outside the County either from Northern California or from the Colorado River. Reclaimed water is the effluent produced by the Whittier Narrows Water Reclamation Plant, the San Jose Creek Water Reclamation Plant, and the Pomona Water Reclamation Plant, all operated by the Los Angeles County Sanitation District.

The importance of this activity is apparent when it is realized that about 30 to 40 percent of the water used in the County is pumped from groundwater supplies. The growth of the County, combined with periodic droughts, has seriously depleted these supplies on numerous occasions.

The Department's policy is to conserve the maximum possible amount of storm water consistent with runoff quantity and quality, capacities of the spreading facilities, and groundwater conditions.

### IMPORTED WATER

During the reporting period, the Department received water imported from the Colorado River and the State Water Project by the Metropolitan Water District (MWD) and spread it in the Coastal Plain at the Department's Rio Hondo and San Gabriel Coastal Spreading Grounds on behalf of the Water Replenishment District of Southern California. MDW water is also spread in the main basin, upper San Gabriel Canyon Basin, and Glendora Basin.

The Department spreads imported water from MWD and the San Gabriel Valley Municipal Water District (SGVMWD) in the San Gabriel Valley on behalf of the San Gabriel Valley Municipal Water District, Upper San Gabriel Valley Municipal Water District, and the Three Valleys Municipal Water District in the following facilities:

- San Gabriel Canyon Spreading Grounds
- Santa Fe Spreading Grounds
- San Gabriel River
- Little Dalton Spreading Grounds
- Forbes Spreading Grounds
- Irwindale Spreading Basin/Manning Pit
- Citrus
- Ben Lomond
- Valley Rubber Dam

## WATER CONSERVATION

### RECYCLED WATER

The County Sanitation District's Whittier Narrows Water Reclamation Plant effluent purchased by the Water Replenishment District of Southern California is transported to the Rio Hondo and San Gabriel Coastal Basin Spreading Grounds for groundwater replenishment.

The County Sanitation District's San Jose Creek Water Reclamation Plant made its first delivery of effluent in November 1972. The effluent released into San Jose Creek, San Gabriel River, or directly delivered to San Gabriel Coastal Spreading Ground via pipeline can be purchased by the Water Replenishment District of Southern California.

Water from the Pomona Reclamation Plant is released down the San Jose Creek - San Gabriel River System to the Department's recharge facilities in the Central Basin spreading grounds.

The maximum amount of reclaimed water allowed for spreading in the Montebello Forebay, effective July 1991, is 60,000 acre-feet per year but not to exceed 150,000 acre-feet over a three-year period.

### SEAWATER BARRIER PROJECTS

The Department operates three barrier projects to protect the groundwater in the West Coast and Central Basins against seawater intrusion by creating freshwater pressure ridges along the coastline. The pressure ridges are created by injecting freshwater through a series of injection wells. The amounts of water injected by these wells during the reporting period are as follows:

Facility	Imported Water (Acre-Feet)	Recycled Water (Acre-Feet)
Alamitos Barrier Project:		
Los Angeles Portion	3,848	0
Orange County Portion *	1,703	0
Dominguez Gap Barrier Project	5,885	0
West Coast Basin Barrier Project	11,372	6,241

*\*Injected on behalf of the Orange County Water District*

### SEASONAL DATA AND MAPS

During the reporting period, weekly, monthly, and semi-annual measurements of groundwater levels in observation wells located throughout the groundwater basins in Los Angeles County were made and processed.

Locations of the key wells noted herein are shown on the well map in the Water Conservation summary section. Historical key well level data can be downloaded as [ASCII](#) file or from the pull down selection in the Water Conservation summary section.

Static groundwater elevation contour maps for the three major groundwater regions in Los Angeles County are available from the local basin water agencies:

**GROUNDWATER BASINS AND GROUNDWATER RECHARGE**

Groundwater in Los Angeles County is stored in basins underlying five major geographic areas. These groundwater basins are separated by geologic features, which impede groundwater movement, or by political boundaries. A map of these groundwater basins and the Department's spreading grounds is available upon request from the Department. General spreading ground facility information is included in the summary section. Monthly water conservation data for the reporting period at the Department's facilities and other pertinent facilities are included in the Water Conservation Summary section of this report. The monthly imported and recycled water deliveries for the reporting period are also included in the Water Conservation summary section. The following is a background summary of the Department's groundwater recharge activities within each of these major areas:

**COUNTY-WIDE**

The Department operates 2,436 acres of spreading grounds and soft-bottom channel spreading areas for replenishment of local groundwater supplies. The Department also assisted in the operation and maintenance of 269 acres of spreading grounds owned by others. An additional 656 acres of spreading grounds are controlled maintained and operated by other agencies. The total gross acreage of spreading grounds in Los Angeles County is 3,361 acres.

Groundwater replenishment consists of storm runoff, imported water, and recycled water. County-wide, the Department spread the following amounts during the reporting period:

County Rainfall Index (% of Normal)	53 *
Storm Runoff (acre-feet)	95,166
Imported Water (acre-feet)	28,588
Recycled Water (acre-feet)	48,233

The Department is continuing its efforts to improve its water spreading facilities in order to maximize the amount of water conserved and to simplify the spreading operations.

<b>WATER CONSERVATION</b>
---------------------------

**SAN GABRIEL VALLEY**

The Department operates 20 spreading facilities in the San Gabriel Valley that receive direct valley runoff and flows from the San Gabriel Mountains. Some of these facilities can also receive imported water. Valley-wide, the Department spread the following amounts during the reporting period:

Storm Runoff (acre-feet)	42,585
Imported Water (acre-feet)	28,587
Diversions to Grounds Owned by Others (acre-feet)	7,691

The Department's spreading grounds replenished the Valley's several groundwater basins as follows:

	<b>Storm Water (acre-feet)</b>	<b>Imported Water (acre-feet)</b>	<b>Key Wells</b>
Main San Gabriel Basin	29,341	20,351	3030F, 2965C
Upper San Gabriel Canyon Basin	16,353	3,944	4284A
Lower San Gabriel Canyon Basin	909	0	4285

## WATER CONSERVATION

### COASTAL PLAIN

The groundwater basins underlying the Coastal Plain are divided by geological features into the Central (includes the Montebello and Los Angeles Forebays), West Coast, Santa Monica, and Hollywood Basins. Most of the water is spread in the Montebello Forebay. The Department spread the following amounts in the Coastal Plain during the reporting period:

Storm Runoff (acre-feet)	30,229
Imported Water (acre-feet)	0
Recycled Water (acre-feet)	48,233

The Central Basin has the most storage capacity of the basins in the Coastal Plain. In addition to the water recharged in the Department's spreading facilities, water injected in the Alamitos Barrier Project also contributes to the replenishment of the pressure aquifers underlying the Central Basin. The basin contains Key Well Nos. 460K, 1601T, and 906D.

### West Coast Basin

The West Coast basin is the second largest basin underlying the Coastal Plain and is separated by the Newport-Inglewood Fault zone. Groundwater is primarily recharged by Central Basin subsurface flows and by water injected by the Department in the West Coast Basin and Dominguez Gap Barrier Projects. Groundwater elevations in the West Coast basin are below sea level except in the area of the West Coast Basin Barrier injection mound. The basin contains Key Well Nos. 1346D and 760C.

### Santa Monica and Hollywood Basins

The Department has no spreading facilities in either of these basins.

<b>WATER CONSERVATION</b>
---------------------------

**SAN FERNANDO VALLEY**

The San Fernando Valley is also known as the Upper Los Angeles River Area (ULARA). Most of the runoff from the surrounding mountains flows to the Valley. The Valley comprises of four basins:

**San Fernando Main Basin**

The basin is the largest basin underlying the San Fernando Valley. The basin contains Key Well Nos. 3872H and 4709. The Department spread the following during the reporting period:

Storm Runoff (acre-feet)	14,662
Imported Water (acre-feet)	0
Recycled Water (acre-feet)	0

**Sylmar , Verdugo, and Eagle Rock Basins**

The Department has no spreading facilities in these much smaller basins.

**SANTA CLARITA VALLEY**

The Department has no spreading facilities in the area. Much of the Valley is open space, permitting substantial natural percolation.

The Upper Santa Clarita subunit comprises five basins.

**ANTELOPE VALLEY**

There are several groundwater subbasins underlying the Antelope Valley. Five of them are located within Los Angeles County.

The Department operates no spreading facilities in the Antelope Valley.

Key Well Nos. 9974 and 8825 are located in the Lancaster and Little Rock subbasins, respectively.

## RUNOFF - STREAM GAGING STATION INFORMATION

# ARCADIA WASH

*below Grand Avenue*

## STATION NO. F317-R

**RECORDER** 5 min. interval data logger.

**METHOD OF MEASUREMENT** low flows measured by wading. High flows measured from upstream side of Grand Avenue bridge.

**DRAINAGE AREA** 8.50 square miles.

**LOCATION** on the west wall of Arcadia Wash about 75 feet downstream from centerline of Grand Avenue.

**REGULATION** several debris basins located upstream.

**DIVERSION** none.

**CHANNEL** concrete, rectangular section.

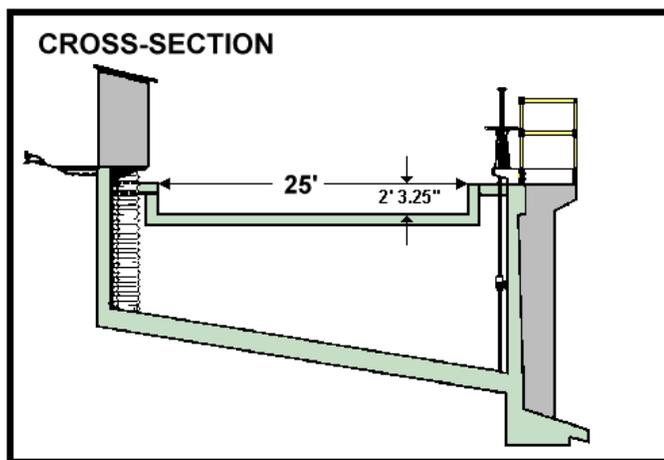

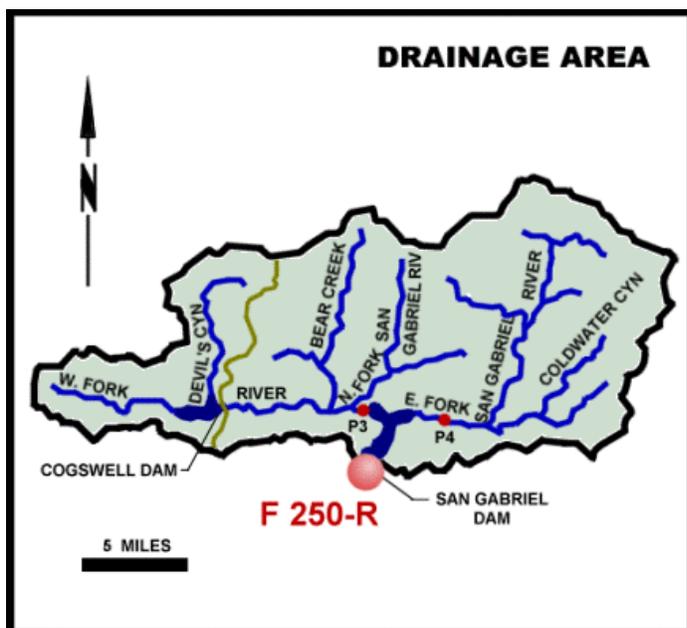

**CONTROL**

**LENGTH OF RECORD** December 12, 1955 to date.

## RUNOFF - STREAM GAGING STATION INFORMATION

# AZUSA CONDUIT

(Sandbox 20' weir)  
STATION NO. F250-R

**RECORDER** 5 min. interval data logger.

**METHOD OF MEASUREMENT** weir formula with gage height observation.

**DRAINAGE AREA** 202.70 square miles.

**LOCATION** on the concrete conduit which diverts from San Gabriel Dam, 160 feet below the dam.

**REGULATION** regulated in section.

**DIVERSION** none.

**CHANNEL** 25-foot concrete weir.

**CONTROL** channel forms control.

**LENGTH OF RECORD** February 26, 1933 to date.

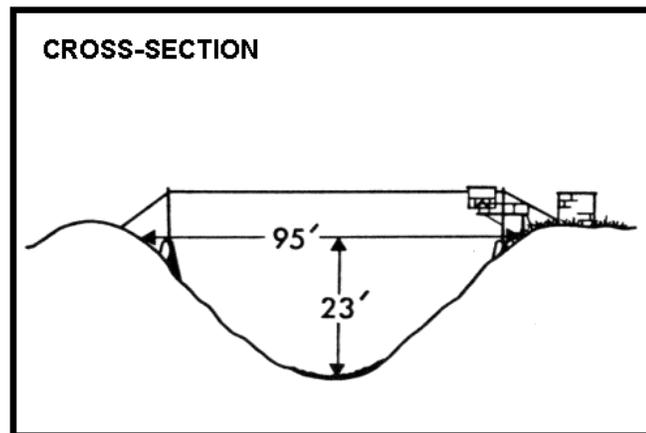

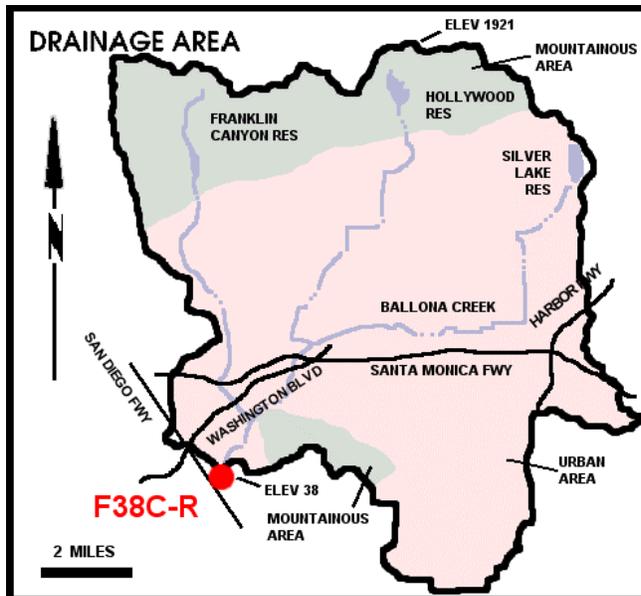

**REMARKS** approximate capacity 95 second-feet.

## RUNOFF - STREAM GAGING STATION INFORMATION

# BALLONA CREEK

*above Sawtelle Blvd.*

## STATION NO. F38C-R

**RECORDER** continuous water stage.

**METHOD OF MEASUREMENT** wading or from cable car.

**DRAINAGE AREA** 88.60 square miles.

**LOCATION** 530.0 feet above Sawtelle Boulevard, 1.5 miles southwest of Culver City.

**REGULATION** Stone Canyon Reservoir prior to January, 1951. Upper and Lower Franklin Canyon Reservoir, Hollywood Reservoir, and Silverlake Reservoir.

\* Incomplete Record SAN GABRIEL RIVER BELOW MORRIS DAM OUTFLOW STATION U-8R AXSYS RECORDER DATA ARE BASE ON DAM RECORD AND WEEKLY VISITATION RECORD. THE SLUCING MADE FROM MORRIS DAM CAUSED THE STATION COMMUNICATION HOLES TO PLUG UP WITH MUD AND SAND. DATA FROM 05-13-99 TO PRESENT ARE ACTUAL FLOW AFTER CLEANED OUT BY FLOOD MAINTENANCE.

**PECK ROAD**

**Type** DEEP  
**Season First Used** 1959-60  
**Area**           **Gross** 157 ACRES  
                   **Wetted** 105 ACRES  
**Capacities**   **Channel\*\*** 30,100 CFS  
                   **Intakes** 30,100 CFS  
                   **Storage** 3,347 AF  
                   **Percolation\*** 25 CFS  
**Location** CONFLUENCE OF SAWPIT AND SANTA ANITA WASHES.  
**Source of Water** CONTROLLED RELEASES FROM SANTA ANITA AND SAWPIT DEBRIS  
 BASINS AND UNCONTROLLED FLOWS FROM LOCAL RUNOFF VIA  
 SAWPIT AND SANTA ANITA WASHES.  
**Remarks** INSTREAM SPREADING FACILITY.  
               \* THE CAPACITY LISTED IS ESTIMATES OF INFILTRATION RATES.  
               \*\* DESIGN CAPACITY OF MAIN CHANNEL.

**RIO HONDO COASTAL**

**Type** SHALLOW  
**Season First Used** 1937-38  
**Area**           **Gross** 570 ACRES  
                   **Wetted** 430 ACRES  
**Capacities**   **Channel\*\*** 40,000 CFS  
                   **Intakes** 1,950 CFS  
                   **Storage** 3,694 AF  
                   **Percolation\*** 400 CFS  
**Location** EASTERLY SIDE OF RIO HONDO SOUTHERLY FROM S. P. R. R. (SOUTH  
 OF WHITTIER BLVD.) TO SLAUSON AVENUE; WEST SIDE OF RIO HONDO  
 CHANNEL FROM 0.2 MILE ABOVE WHITTIER BOULEVARD SOUTH TO  
 FOSTER BRIDGE BOULEVARD.

 FE AND WHITTIER NARROWS DAMS. UNCONTROLLED RUNOFF VIA  
 SAN GABRIEL RIVER, RIO HONDO CHANNEL AND THEIR TRIBUTARIES;  
 ALSO IMPORTED AND RECLAIMED WATER.  
**Remarks** IN COOPERATION WITH THE CORPS OF ENGINEERS. THE DISTRICT  
 OPERATES 1,200 ACRE-FOOT POOL AT WHITTIER NARROWS DAM FOR  
 RETENTION OF STORM WATER.  
               \* THE CAPACITY LISTED IS ESTIMATES OF INFILTRATION RATES.  
               \*\* DESIGN CAPACITY OF MAIN CHANNEL.

**S.G. RIVER (MONTEBELLO FOREBAY)**

**Type** SHALLOW  
**Season First Used** 1954-55  
**Area**           **Gross** 308 ACRES  
                   **Wetted** 308 ACRES  
**Capacities**   **Channel\*\*** 20,000 CFS  
                   **Intakes** In river Percolation  
                   **Storage** 913 AF  
                   **Percolation\*** 75 CFS  
**Location** HEADWORKS TO FIRESTONE AVE. ONLY. STORAGE BEHIND THE SEVEN  
 RUBBER DAMS INSTALLED ON DROP STRUCTURE.  
**Source of Water** SAME AS SAN GABRIEL COASTAL.  
**Remarks**  
               \* THE CAPACITY LISTED IS ESTIMATES OF INFILTRATION RATES.  
               \*\* DESIGN CAPACITY OF MAIN CHANNEL.
